Ian Bharrat

Part 1:

I feel as though the Dav persona would have a fairly easy time interacting with our class project. Although they are not the most familiar with technology they still shouldn't struggle due to the fact that the app we made is easy to navigate. A problem that may arise though is with their access to reliable technology. If they have a bad internet connection they may experience some problems with the app.

Part 2:

Some issues that may affect certain groups can include things like accessibility. Sometimes the fonts and colors used in these apps are not the easiest to read, and that can be difficult for those with visual problems. Additionally making the interface too complex can also be an issue for those who aren't that comfortable with technology.

Part 3:

For the accessibility issues I would focus on learning about what color schemes and fonts are easy to read and then apply that to my app. Prioritizing this will allow for all types of people to be able to use the meditation app without an extra struggle. Additionally having good design practices when making the application is a good solution to combat making a complex interface. By keeping things uncluttered and easy to understand it will be easy for all people to interact with the app.
